Crawl spaces have high moisture and humidity that leads to **mold** insects, and **termites**. If the crawl area is dry it would prevent mold, insects and termites. The untrained eye may not be able to see that the wood is wet or damp. That's why we inspect your crawl space area to determine whether or not it has a moisture problem

**Crawl space Dirt Floor.** This is one of the most important areas to make sure is sealed, and to keep moisture out. Water that is in the soil will sit under your home, causing humidity and a perfect moist environment for mold growth. Once mold begins to form, it will feed on any organic food it can find, including your wooden foundation support beams.

**Poor Construction.** Contractors rarely, if ever, completely seal off the crawl space area when the home is being built. After a short period of time, moisture can find its way into your crawl space, and begin to deteriorate your wood joists, beams and foundation.

**Gaps Where the Crawl space Wall Meets the Home.** Humidity and moisture can be drawn into your home by pressure. Since air flows upwards, moisture can be drawn into your crawl space area by any gaps or cracks.

**Financing available**
